

Hrvatski nacionalni profil metapodataka

Željko HEĆIMOVIĆ, Državna geodetska uprava, Gruška 20, Zagreb

Zakon o državnoj izmjeri i katastru nekretnina (NN 16/07, 124/19), u dalnjem tekstu: Zakon, definira metapodatke kao informacije koje opisuju skupove i servise prostornih podataka i omogućuju njihovo otkrivanje, pregled i uporabu. Metapodaci ključni su element uspostave nacionalne infrastrukture prostornih podataka (NIPP). Nažalost, samo rijetki subjekti hrvatskoga NIPP-a raspolažu danas metapodacima svojih podataka. Sljedeći problem je u tome da i postojeći metapodaci nisu standardizirani i uskladeni s europskim normama i propisima vezanim uz metapodatke. Zakon dalje navodi da su subjekti NIPP-a dužni svoje metapodatke redovito održavati, a na zahtjev Državne geodetske uprave (DGU) staviti ih na raspolaganje kako bi DGU mogao uspostaviti i održavati javni servis metapodataka na internetu (putem geoportala). Pred DGU-om, ali i svim subjektima NIPP-a veliki je zadatak uspostava kataloga metapodataka. Da bi katalog metapodataka mogao biti uspostavljen potrebno je prvo usvojiti potrebne specifikacije te izraditi nacionalni profil metapodataka.

Vlada Republike Hrvatske usvojila je u kolovozu 2010. Provedbena pravila za metapodatke (NN 102/10) koja su u potpunosti uskladena s Provedbenim pravilima za metapodatke INSPIRE-a. Sljedeći korak bila je izrada nacionalnog profila metapodataka. DGU je u 2011. godini uz stručnu potporu Radne skupine za tehničke standarde NIPP-a i konzultantanata iz njemačke tvrtke Conterra, izradio nacrt hrvatskoga nacionalnog profila metapodataka. Profil bi trebao zadovoljiti potrebe svih subjekata NIPP-a i trebao bi se temeljiti na postojećim specifikacijama i normama, tj. Provedbenim pravilima za metapodatke, HRN EN ISO 19115 Metapodaci, HRN EN ISO 19119 Usluge i svim ostalim relevantnim ISO normama te biti uskladen s Provedbenim pravilima za metapodatke INSPIRE-a. Nacionalni profil metapodataka mora biti jednostavan i interoperabilan u odnosu na INSPIRE, te s druge strane takav da ga pojedini subjekti NIPP-a u skladu sa svojim potrebama mogu proširiti i sami definirati profile metapodataka za svoje specifične skupove podataka.

Cilj prezentacije je informirati subjekte NIPP-a o izrađenom prijedlogu nacionalnog profila metapodataka kako bismo dobili što više povratnih informacija te tako izradili nacionalni profil na zadovoljstvo svih subjekata hrvatskog NIPP-a.

Ključne riječi: metapodaci, nacionalni profil metapodataka, provedbena pravila, subjekti NIPP-a, standardi

Role of Quality Control in SDI Establishment

Dragan DIVJAK, Vladimir BARIČEVIĆ, Geofoto d.o.o., Buzinski prilaz 28, 10 000 Zagreb, Croatia

Unlike the situation from a few decades ago, when spatial data did not exist or were not available, the current problem is how to find information which will satisfy our needs. Many developed countries, including Croatia, completed collecting topographic data for the entire country, and different sets of data are available on the market. Information about data quality for estimating the extent to which these data correspond to user needs is very difficult and sometimes impossible to find. Problems arising from this situation will become more prominent within the spatial data infrastructure, the main goal of which is to connect different spatial datasets in an interoperable manner.

The International Standardization Organization (ISO) recognized the importance of spatial data quality in the ISO 19100 series of standards and some of the first standards were dedicated to spatial data quality. These are primarily 19113 – Quality Principles, 19114 – Quality Evaluation Procedures and 19115 – Metadata, which regulates the manner in which it is necessary to report results of quality control. Subsequently, ISO released 19131 – Data Product Specifications, 19138 – Data Quality Measures, while the last two standards under development are also dedicated to quality control: 19157 – Data Quality and 19158 – Quality Assurance of Data Supply. Due to insufficient information, expertise, and cost required to implement a quality control system, quality control hasn't received enough deserved attention until several years ago.

EuroGeographics, the umbrella association of national mapping and cadastral agencies in Europe, recognized the importance of spatial data quality control in development of spatial data infrastructures. National mapping and cadastral agencies are responsible for production and distribution of reference spatial data sets within national spatial data infrastructures. Thus ensuring their quality and providing information about the quality of these datasets is of utmost importance. Therefore, in order to promote a wider usage of ISO standards, the EuroGeographics' working group on data quality published a guide for implementing ISO standards directly related to spatial data quality.

Awareness of the importance of spatial data quality is developing and can be seen in international tenders, where national mapping and cadastral agencies are asking descriptions of quality management system, plans for ensuring project quality and the final product. In order to be able to respond to market demands, it is inevitable to continuously improve the internal quality control system in accordance with international recommendations (ESDIN, EuroGeographics, ISO, NATO ...), because it increases the competitiveness of products and services. The paper will present trends in the establishment of quality control, whose implementation is recommended to producers to be able to deliver the required quality of spatial data to their customers.

Keywords: Quality control, NSDI, international standards
